Will not be using RadioLib

The eBook mentions the possibility of using RadioLib as the LoRa P2P enabler. RadioLib is, in my personal opinion, far more mature than the library currently in use. However, RadioLib will not be attempted since the project uses Arduino's MKR WAN 1310 microcontroller/transceiver.

RadioLib is not officially supported on the Arduino MKR WAN 1310, although it can be compiled on and loaded onto that device. The board's Murata CMWX1ZZABZ module (SX1276) is designed primarily for the MKRWAN library (LoRaWAN) or Sandeep Mistry's arduino-LoRa library (P2P). Direct RadioLib access requires "dumb mode," a specific SPI bus (SPI1), lower SPI clock speed, and a hardware reset sequence. Results can be unreliable (chip-not-found errors, transmit timeouts, missing interrupts). Thus, the recommended and far more reliable approach for LoRa P2P on the MKR WAN 1310 is the arduino-LoRa library.
